About RAND

The RAND Corporation is a research organization that develops solutions to public policy challenges to help make communities throughout the world safer and more secure, healthier and more prosperous. RAND is nonprofit, nonpartisan, and committed to the public interest. To learn more about RAND, visit www.rand.org

Research Integrity

Our mission to help improve policy and decisionmaking through research and analysis is enabled through our core values of quality and objectivity and our unwavering commitment to the highest level of integrity and ethical behavior. To help ensure our research and analysis are rigorous, objective, and nonpartisan, we subject our research publications to a robust and exacting quality-assurance process; avoid both the appearance and reality of financial and other conflicts of interest through staff training, project screening and a policy of mandatory disclosure; and pursue transparency in our research engagements through our commitment to the open publication of our research findings and recommendations, disclosure of the source of funding of published research, and policies to ensure intellectual independence. For more information, visit www.rand.org/about/principles.

Executive Summary

Weakening Germany, strengthening the U.S.

The present state of the U.S. economy does not suggest that it can function without financial and material support from external sources. The quantitative easing policy, which the Fed has resorted to regularly in recent years, as well as the uncontrolled issue of cash during the 2020 and 2021 Covid lockdowns, have led to a sharp increase in the external debt and an increase in the dollar supply.

The continuing deterioration of the economic situation is highly likely to lead to a loss in the position of the Democratic Party in Congress and the Senate in the forthcoming elections to be held in November 2022. The impeachment of the President cannot be ruled out under these circumstances, which must be avoided at all costs.

There is an urgent need for resources to flow into the national economy, especially the banking system. Only European countries bound by EU and NATO commitments will be able to provide them without significant military and political costs for us.

The major obstacle to it is growing independence of Germany. Although it still is a country with limited sovereignty, for decades it has been consistently moving toward lifting these limitations and becoming a fully independent state. This movement is slow and cautious, but steady. Extrapolation shows that the ultimate goal can be reached only in several decades. However, if social and economic problems in the United States escalate, the pace could accelerate significantly.

An additional factor contributing to Germany's economic independence is Brexit. With the withdrawal of the UK from the EU structures, we have lost a meaningful opportunity to influence the negotiation of crossgovernmental decisions.

It is fear of our negative response which by and large determines the relatively slow speed of those changes. If one day we abandon Europe, there will be a good chance for Germany and France to get to a full political consensus. Then, Italy and other Old Europe countries - primarily the former ECSC members - may join it on certain conditions. Britain, which is currently outside the European Union, will not be able to resist the pressure of the Franco-German duo alone. If implemented, this scenario will eventually turn Europe into not only an economic, but also a political competitor to the United States.

Besides, if the U.S. is for a certain period is engulfed by domestic problems, the Old Europe will be able to more effectively resist the influence of the U.S.-oriented Eastern European countries.

Vulnerabilities in German and EU Economy

An increase in the flow of resources from Europe to U.S. can be expected if Germany begins to experience a controlled economic crisis. The pace of economic development in the EU depends almost without alternative on the state of the German economy. It is Germany that bears the brunt of the expenditure directed towards the poorer EU members.

The current German economic model is based on two pillars. These are unlimited access to cheap Russian energy resources and to cheap French electric power, thanks to the operation of nuclear power plants. The importance of the first factor is considerably higher. Halting Russian supplies can well create a systemic crisis that would be devastating for the German economy and, indirectly, for the entire European Union.

The French energy sector could also soon begin to experience heavy problems. The predictable stop of Russian-controlled nuclear fuel supplies, combined with the unstable situation in the Sahel region, would make French energy sector critically dependent on Australian and Canadian fuel. In connection with the establishment of AUKUS, it creates new opportunities to exercise pressure. However this issue is beyond the scope of the present report.

A Controlled Crisis

Due to coalition constraints, the German leadership is not in full control of the situation in the country. Thanks to our precise actions, it has been possible to block the commissioning of the Nord Stream 2 pipeline, despite the opposition of lobbyists from the steel and chemical industries. However, the dramatic deterioration of the living standards may encourage the leadership to reconsider its policy and return to the idea of European sovereignty and strategic autonomy.

The only feasible way to guarantee Germany's rejection of Russian energy supplies is to involve both sides in the military conflict in Ukraine. Our further actions in this country will inevitably lead to a military response from Russia. Russians will obviously not be able to leave unanswered the massive Ukrainian army pressure on the unrecognized Donbas republics. That would make possible to declare Russia an aggressor and apply to it the entire package of sanctions prepared beforehand.

Putin may in turn decide to impose limited counter-sanctions - primarily on Russian energy supplies to Europe. Thus, the damage to the EU countries will be quite comparable to the one to the Russians, and in some countries - primarily in Germany - it will be higher.

The prerequisite for Germany to fall into this trap is the leading role of green parties and ideology in Europe. The German Greens are a strongly dogmatic, if not zealous, movement, which makes it quite easy to make them ignore economic arguments. In this respect, the German Greens somewhat exceed their counterparts in the rest of Europe. Personal features and the lack of professionalism of their leaders - primarily Annalena Baerbock and Robert Habeck - permit to presume that it is next to impossible for them to admit their own mistakes in a timely manner.

Thus, it will be enough to quickly form the media image of Putin's aggressive war to turn the Greens into ardent and hardline supporters of sanctions, a 'party of war'. It will enable the

sanctions regime to be introduced without any obstacles. The lack of professionalism of the current leaders will not allow a setback in the future, even when the negative impact of the chosen policy becomes obvious enough. The partners in the German governing coalition will simply have to follow their allies - at least until the load of economic problems outweighs the fear of provoking a government crisis.

However, even when the SPD and the FDP are ready to go against the Greens, the possibility for the next government to return relations with Russia to normal soon enough will be noticeably limited. Germany's involvement in large supplies of weapons and military equipment to the Ukrainian army will inevitably generate a strong mistrust in Russia, which will make the negotiation process quite lengthy.

If war crimes and Russian aggression against Ukraine are confirmed, the German political leadership will not be able to overcome its EU partners' veto on assistance to Ukraine and reinforced sanctions packages. This will ensure a sufficiently long gap in cooperation between Germany and Russia, which will make large German economic operators uncompetitive.

Expected Consequences

A reduction in Russian energy supplies - ideally, a complete halt of such supplies - would lead to disastrous outcomes for German industry. The need to divert significant amounts of Russian gas for winter heating of residential and public facilities will further exacerbate the shortages. Lockdowns in industrial enterprises will cause shortages of components and spare parts for manufacturing, a breakdown of logistic chains, and, eventually, a domino effect. A complete standstill at the largest in the chemical, metallurgical, and machine-building, plants is likely, while they have virtually no spare capacity to reduce energy consumption. It could lead to the shutting down of continuous-cycle enterprises, which would mean their destruction.

The cumulative losses of the German economy can be estimated only approximately. Even if the restriction of Russian supplies is limited to 2022, its consequences will last for several years, and the total losses could reach 200-300 billion euros. Not only will it deliver a devastating blow to the German economy, but the entire EU economy will inevitably collapse. We are talking not about a decline in economy growth pace, but about a sustained recession and a decline in GDP only in material production by 3-4% per year for the next 5-6 years. Such a fall will inevitably cause panic in the financial markets and may bring them to a collapse.

The euro will inevitably, and most likely irreversibly, fall below the dollar. A sharp fall of euro will consequently cause its global sale. It will become a toxic currency, and all countries in the world will rapidly reduce its share in their forex reserves. This gap will be primarily filled with dollar and yuan.

Another inevitable consequence of a prolonged economic recession will be a sharp drop in living standards and rising unemployment (up to 200,000-400,000 in Germany alone), which will entail the exodus of skilled labour and well-educated young people. There are literally no other destinations for such migration other than the United States today. A somewhat smaller, but also

quite significant flow of migrants can be expected from other EU countries.

The scenario under consideration will thus serve to strengthen the national financial condition both indirectly and most directly. In the short term, it will reverse the trend of the looming economic recession and, in addition, consolidate American society by distracting it from immediate economic concerns. This, in turn, will reduce electoral risks.

In the medium term (4-5 years), the cumulative benefits of capital flight, re-oriented logistical flows and reduced competition in major industries may amount to USD 7-9 trillion.

Unfortunately, China is also expected to benefit over the medium term from this emerging scenario. At the same time, Europe's deep political dependence on the U.S. allows us to effectively neutralise possible attempts by individual European states to draw closer to China.
